3.1 Introduction

We would want the robot to be able to reason and maintain correctly the distinct human beliefs. Despite modeling distinct beliefs, HATP/EHDA doesn't maintain in a principled way, only in a scripted way (domain specific). Here we propose some models and algorithms to integrated some concept of Theory of Mind in the planning process of HATP/EHDA.

Explaining false belief task (Sally and Anne)

3.2 Related works

3.2.1 epistemic planning

3.2.2 DEL

3.3 Maintaining the human beleifs

3.3.1 Enhanced problem specification

symbolic locations + state variable observability types

3.3.2 Situation Assessment Processes

Learn from observation of either: action execution or observable state.

3.4 Relevant False human beliefs

3.4.1 Detection

3.4.2 Resolution with minimal communication

3.4.3 Resolution by delaying non-observed robot action

3.5 Result

3.6 Discussion and Limitations

3.7 Conclusion

A Task planner making a robot compliant to human online decisions and preferences

5.2	Related work	11
5.3	Description	11
5.4	Study protocol	11
5.5	Study results	12
5.6	Discussion	12
5.7	Conclusion	12

5.1 Introduction

why simulation: HRI rebuttal: we rely on a reactive execution, real life robot are slow and not very reactive thus may bias our results

5.2 Related work

of plan+execution, simulator

5.3 Description

- planning is same
 - execution is based on model of execution and mock components
 - human collaborates in real time with robot in blockwords task
 - describe simulator, mouse, robot and human capabilities, goal shown, prompt

5.4 Study protocol

objective, participants, material, experiment design, procedure, measures

5.5 Study results

5.6 Discussion

5.7 Conclusion
